

Feature: Validating User Login and Registration

Scenario: Validating User Registration

Given User is on application page
When User clicks on signup option
And User enters input for all required fields
And User clicks on register button
Then User validates successful message

Scenario Outline: Validating login with Valid credentials

Given User is on application page
When User enter username "<username>" and password "<password>"
And User clicks on login button
Then User validates successful message

Examples:

username	password
abc@gmail.com	12345

Scenario Outline: Validating login with Invalid credentials

Given User is on application page
When User enter username "<username>" and password "<password>"
And User clicks on login button
Then User validates successful message

Examples:

username	password
Bal123	1231

Feature: Validating product page and cart page

Scenario: Validating product details page

Given User is on Application page
When User click on specified product category
And User selects particular product
Then User should able to see details of selected product

Scenario: Validating add to card page

Given User should see the selected product details
And User should able to see add to cart option
When User should click on add to cart option
Then Product should be added to the cart

Scenario: Validating remove option in add to card page

Given User is on cart page
And User should able to see added product in cart page
When User clicks on remove button

Then Product in cart page should be updated accordingly with price

Scenario: Validating place order option in cart page

Given User is on cart page

And User should able to see Place order option in cart page

When User click on place order option

Then Validates user navigates to Payment page

Scenario: Validating payment page for total value

Given User is on payment page

And User should able to see amount displayed for selected product

And User should able to see total amount for all selected product

Then User should validates Total amount with sum of all added products.

Then Product in cart page should be updated accordingly with price

Given User is on Delivery information after succesful transaction

Then User should validates all the information in delivery page is displayed as per the input

Automation Test Cases:

All Manual Test cases can be automated except OTP Validation(Payment), Captcha, Images, Responsive Design Testing(needed visual monitoring of multiple devices) .

Test Plan-2 Week Sprint

Week 1- Analysing the requirement

- Getting clarified with all doubts regarding user stories

- Prepare Manual Test cases and Test data

- Manual testing

Week 2- Prepare automation script

- Automation Testing with different inputs

- If any deviation will follow Defect life cycle to fix it.

- Regression(if possible) at the end of the sprint
